

FEATURES

Precision 1.000 V voltage reference
Ultracompact 3 mm × 3 mm SOT-23 package
No external capacitor required
Low output noise: 4 μ V p-p (0.1 Hz to 10 Hz)
Initial accuracy: $\pm 0.35\%$ maximum
Temperature coefficient: 70 ppm/ $^{\circ}$ C maximum
Operating current range: 100 μ A to 10 mA
Output impedance: 0.3 Ω maximum
Temperature range: -40° C to $+85^{\circ}$ C

APPLICATIONS

Precision data acquisition systems
Battery-powered equipment
Cellular phone
Notebook computer
PDA
GPS
3 V/5 V, 8-/12-bit data converters
Portable medical instruments
Industrial process control systems
Precision instruments

GENERAL DESCRIPTION

Designed for space critical applications, the ADR510 is a low voltage (1.000 V), precision shunt-mode voltage reference in an ultracompact (3 mm × 3 mm) SOT-23-3 package. The ADR510 features low temperature drift (70 ppm/ $^{\circ}$ C), high accuracy ($\pm 0.35\%$), and ultralow noise (4 μ V p-p) performance.

The ADR510 advanced design eliminates the need for an external capacitor, yet it is stable with any capacitive load. The minimum operating current increases from 100 μ A to a maximum of 10 mA. This low operating current and ease of use make the ADR510 ideally suited for handheld battery-powered applications.

A TRIM terminal is available on the ADR510 to provide adjustment of the output voltage over $\pm 0.5\%$ without affecting the temperature coefficient of the device. This feature provides users with the flexibility to trim out any system errors.

SPECIFICATIONS

ELECTRICAL CHARACTERISTICS

$I_{IN} = 100 \mu A$ to 10 mA @ $T_A = 25^\circ C$, unless otherwise noted.

Table 2.

Parameter	Symbol	Conditions	Min	Typ	Max	Unit
Output Voltage ¹	V_{OUT}		0.9965	1.0	1.0035	V
Initial Accuracy	V_{OUTERR}		–3.5		+3.5	mV
	$V_{OUTERR\%}$		–0.35		+0.35	%
Temperature Coefficient, A Grade	TCV_{OUT}	$0^\circ C < T_A < 70^\circ C$			70	ppm/ $^\circ C$
		$-40^\circ C < T_A < +85^\circ C$			85	ppm/ $^\circ C$
Output Voltage Change vs. I_{IN}	ΔV_R	$I_{IN} = 0.1 \text{ mA to } 10 \text{ mA}$			3	mV
Dynamic Output Impedance	$(\Delta V_R / \Delta I_R)$	$I_{IN} = 1 \text{ mA} \pm 100 \mu A$			0.3	Ω
Minimum Operating Current	I_{IN}	$0^\circ C < T_A < 70^\circ C$	100			μA
Voltage Noise	$e_N \text{ p-p}$	$f = 0.1 \text{ Hz to } 10 \text{ Hz}$		4		$\mu V \text{ p-p}$
Turn-On Settling Time ²	t_R	To within 0.1% of output		10		μs
Output Voltage Hysteresis	V_{OUT_HYS}			50		ppm

¹ The forward diode voltage characteristic at –1 mA is typically 0.65 V.

² Measured without a load capacitor.

ABSOLUTE MAXIMUM RATINGS

Table 3.

Parameter	Rating
Reverse Current	25 mA
Forward Current	20 mA
Storage Temperature Range	–65°C to +150°C
Operating Temperature Range	–40°C to +85°C
Junction Temperature Range	–65°C to +150°C
Lead Temperature (Soldering, 60 sec)	300°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

THERMAL RESISTANCE

θ_{JA} is specified for the worst-case conditions, that is, a device soldered in a circuit board for surface-mount packages. Package power dissipation = $(T_{JMAX} - T_A)/\theta_{JA}$.

Table 4. Thermal Resistance

Package Type	θ_{JA}	θ_{JC}	Unit
3-Lead SOT-23-3 (RT-3)	230	146	°C/W

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PARAMETER DEFINITIONS

TEMPERATURE COEFFICIENT

This is the change of output voltage with respect to the operating temperature changes, normalized by the output voltage at 25°C. This parameter is expressed in parts per million/degrees Celsius (ppm/°C) and can be determined with the following equation:

$$TCV_{OUT}[\text{ppm}/^{\circ}\text{C}] = \frac{V_{OUT}(T2) - V_{OUT}(T1)}{V_{OUT}(25^{\circ}\text{C}) \times (T2 - T1)} \times 10^6 \quad (1)$$

where:

$V_{OUT}(25^{\circ}\text{C})$ is the output voltage at 25°C.

$V_{OUT}(T1)$ is the output voltage at Temperature 1.

$V_{OUT}(T2)$ is the output voltage at Temperature 2.

THERMAL HYSTERESIS

Thermal hysteresis is the change of output voltage after the device is cycled through the temperature from 25°C to 0°C to 85°C and back to 25°C.

$$V_{OUT_HYS} = V_{OUT}(25^{\circ}\text{C}) - V_{OUT_TC}$$

$$V_{OUT_HYS}[\text{ppm}] = \frac{V_{OUT}(25^{\circ}\text{C}) - V_{OUT_TC}}{V_{OUT}(25^{\circ}\text{C})} \times 10^6 \quad (2)$$

where:

$V_{OUT}(25^{\circ}\text{C})$ is the output voltage at 25°C.

V_{OUT_TC} is the output voltage at 25°C after temperature cycle at +25°C to -40°C to +85°C and back to +25°C.

APPLICATIONS INFORMATION

The ADR510 is a 1.0 V precision shunt voltage reference designed to operate without an external output capacitor between the positive terminal and the negative terminal for stability. An external capacitor can be used for additional filtering of the supply.

As with all shunt voltage references, an external bias resistor (R_{BIAS}) is required between the supply voltage and the ADR510 (see Figure 2). R_{BIAS} sets the current that is required to pass through the load (I_L) and the ADR510 (I_Q). The load and the supply voltage can vary, thus R_{BIAS} is chosen based on the following conditions:

- R_{BIAS} must be small enough to supply the minimum I_Q current to the ADR510 even when the supply voltage is at minimum value and the load current is at maximum value.
- R_{BIAS} also needs to be large enough so that I_Q does not exceed 10 mA when the supply voltage is at its maximum value and the load current is at its minimum value.

Given these conditions, R_{BIAS} is determined by the supply voltage (V_S), the load and operating current (I_L and I_Q) of the ADR510, and the ADR510 output voltage.

$$R_{BIAS} = \frac{V_S - V_{OUT}}{I_L + I_Q} \quad (3)$$

ADJUSTABLE PRECISION VOLTAGE SOURCE

The ADR510, combined with a precision low input bias op amp such as the AD860x, can be used to output a precise adjustable voltage. Figure 11 illustrates implementation of this application using the ADR510.

Output of the op amp, V_{OUT} , is determined by the gain of the circuit, which is completely dependent on the $R2$ and $R1$ resistors.

$$V_{OUT} = 1 + \frac{R2}{R1} \quad (4)$$

An additional capacitor in parallel with $R2$ can be added to filter out high frequency noise. The value of $C2$ is dependent on the value of $R2$.

Figure 11. Adjustable Precision Voltage Source

OUTPUT VOLTAGE TRIM

Using a mechanical or digital potentiometer, the output voltage of the ADR510 can be trimmed $\pm 0.5\%$. The circuit in Figure 12 illustrates how the output voltage can be trimmed using a 10 k Ω potentiometer. Note that trimming using other resistor values may not produce an accurate output from the ADR510.

Figure 12. Output Voltage Trim

USING THE ADR510 WITH PRECISION DATA CONVERTERS

The compact ADR510 and its low minimum operating current requirement make it ideal for use in battery-powered portable instruments, such as the AD7533 CMOS multiplying DAC, that use precision data converters.

Figure 13 shows the ADR510 serving as an external reference to the AD7533, a CMOS multiplying DAC. Such a DAC requires a negative voltage input in order to provide a positive output range. In this application, the ADR510 is supplying a -1.0 V reference to the REF input of the AD7533.

Figure 13. ADR510 as a Reference for a 10-Bit CMOS DAC (AD7533)

PRECISE NEGATIVE VOLTAGE REFERENCE

The ADR510 is suitable for use in applications where a precise negative voltage reference is desired, including the application detailed in Figure 13.

Figure 14 shows the ADR510 configured to provide an output of -1.0 V .

Figure 14. Precise -1.0 V Reference Configuration

Because the ADR510 characteristics resemble those of a Zener diode, the cathode shown in Figure 14 is 1.0 V higher with respect to the anode ($V+$ with respect to $V-$ on the ADR510 package). Because the cathode of the ADR510 is tied to ground, the anode must be -1.0 V .

$R1$ in Figure 14 should be chosen so that $100\text{ }\mu\text{A}$ to 10 mA is provided to properly bias the ADR510.

$$RI = \frac{-1 - (-V_{DD})}{I} \quad (5)$$

The $R1$ resistor should be chosen so that power dissipation is at a minimum. An ideal resistor value can be determined through manipulation of Equation 5.
