## AMDit

## Am27C040

## 4 Megabit (512 K x 8-Bit) CMOS EPROM

## DISTINCTIVE CHARACTERISTICS

- Fast access time
- Available in speed options as fast as 90 ns
- Low power consumption
- <10 $\mu \mathrm{A}$ typical CMOS standby current

■ JEDEC-approved pinout

- Plug-in upgrade for 1 Mbit and 2 Mbit EPROMs
- Easy upgrade from 28-pin JEDEC EPROMs

## Single +5 V power supply

■ $\pm 10 \%$ power supply tolerance standard

- $100 \%$ Flashrite ${ }^{\text {TM }}$ programming
- Typical programming time of 1 minute

Latch-up protected to 100 mA from -1 V to $\mathrm{V}_{\mathrm{Cc}}+1 \mathrm{~V}$
High noise immunity
Compact 32-pin DIP, PDIP, PLCC packages

## GENERAL DESCRIPTION

The Am27C040 is a 4 Mbit ultraviolet erasable programmable read-only memory. It is organized as 512 K bytes, operates from a single +5 V supply, has a static standby mode, and features fast single address location programming. The device is available in windowed ceramic DIP packages and plastic one-time programmable (OTP) packages.

Data can be typically accessed in less than 90 ns , allowing high-performance microprocessors to operate without any WAIT states. The device offers separate Output Enable (OE\#) and Chip Enable (CE\#) controls,
thus eliminating bus contention in a multiple bus microprocessor system.

AMD's CMOS process technology provides high speed, low power, and high noise immunity. Typical power consumption is only 100 mW in active mode, and $50 \mu \mathrm{~W}$ in standby mode.

All signals are TTL levels, including programming signals. Bit locations may be programmed singly, in blocks, or at random. The device supports AMD's Flashrite programming algorithm ( $100 \mu \mathrm{~s}$ pulses) resulting in typical programming time of 1 minute.

## BLOCK DIAGRAM

PRODUCT SELECTOR GUIDE

Valid Combinations list configurations planned to be supported in volume for this device. Consult the local AMD sales office to confirm availability of specific valid combinations and to check on newly released combinations.

## FUNCTIONAL DESCRIPTION

## Device Erasure

In order to clear all locations of their programmed contents, the device must be exposed to an ultraviolet light source. A dosage of 15 W seconds $/ \mathrm{cm}^{2}$ is required to completely erase the device. This dosage can be obtained by exposure to an ultraviolet lamp - wavelength of $2537 \AA$ - with intensity of $12,000 \mu \mathrm{~W} / \mathrm{cm}^{2}$ for 15 to 20 minutes. The device should be directly under and about one inch from the source and all filters should be removed from the UV light source prior to erasure.

Note that all UV erasable devices will erase with light sources having wavelengths shorter than $4000 \AA$ Å, such as fluorescent light and sunlight. Although the erasure process happens over a much longer time period, exposure to any light source should be prevented for maximum system reliability. Simply cover the package window with an opaque label or substance.

## Device Programming

Upon delivery, or after each erasure, the device has all of its bits in the "ONE", or HIGH state. "ZEROs" are loaded into the device through the programming procedure.

The programming mode is entered when $12.75 \mathrm{~V} \pm$ 0.25 V is applied to the $\mathrm{V}_{\mathrm{PP}}$ pin, CE\#/PGM\# is at $\mathrm{V}_{\text {IL }}$ and OE \# is at $\mathrm{V}_{\mathrm{IH}}$.

For programming, the data to be programmed is applied 8 bits in parallel to the data output pins.

The flowchart in the EPROM Products Data Book, Programming section (Section 5, Figure 5-1) shows AMD's Flashrite algorithm. The Flashrite algorithm reduces programming time by using a $100 \mu \mathrm{~s}$ programming pulse and by giving each address only as many pulses to reliably program the data. After each pulse is applied to a given address, the data in that address is verified. If the data does not verify, additional pulses are given until it verifies or the maximum pulses allowed is reached. This process is repeated while sequencing through each address of the device. This part of the algorithm is done at $\mathrm{V}_{\mathrm{CC}}=6.25 \mathrm{~V}$ to assure that each EPROM bit is programmed to a sufficiently high threshold voltage. After the final address is completed, the entire EPROM memory is verified at $\mathrm{V}_{\mathrm{CC}}=\mathrm{V}_{\mathrm{PP}}=5.25 \mathrm{~V}$.
Please refer to the EPROM Products Data Book, Section 5 for the programming flow chart and characteristics.

## Program Inhibit

Programming different data to multiple devices in parallel is easily accomplished. Except for CE\#/PGM\#, all like inputs of the devices may be common. A TTL low-level program pulse applied to one device's CE\#/ PGM\# input with $\mathrm{V}_{\mathrm{PP}}=12.75 \mathrm{~V} \pm 0.25 \mathrm{~V}$ will program
that particular device. A high-level CE\#/PGM\# input inhibits the other devices from being programmed.

## Program Verify

A verification should be performed on the programmed bits to determine that they were correctly programmed. The verify should be performed with OE\# at $\mathrm{V}_{\mathrm{IL}}$, CE\#/ PGM\# at $\mathrm{V}_{\mathrm{IH}}$, and $\mathrm{V}_{\text {PP }}$ between 12.5 V and 13.0 V .

## Auto Select Mode

The autoselect mode provides manufacturer and device identification through identifier codes on DQ0DQ7. This mode is primarily intended for programming equipment to automatically match a device to be programmed with its corresponding programming algorithm. This mode is functional in the $25^{\circ} \mathrm{C} \pm 5^{\circ} \mathrm{C}$ ambient temperature range that is required when programming the device.
To activate this mode, the programming equipment must force $\mathrm{V}_{\mathrm{H}}$ on address line A9. Two identifier bytes may then be sequenced from the device outputs by toggling address line $A 0$ from $\mathrm{V}_{\mathrm{IL}}$ to $\mathrm{V}_{\mathrm{IH}}$ (that is, changing the address from 00h to 01h). All other address lines must be held at $V_{I L}$ during the autoselect mode.

Byte $0\left(A 0=V_{I L}\right)$ represents the manufacturer code, and Byte $1\left(\mathrm{AO}=\mathrm{V}_{\mathrm{IH}}\right)$, the device identifier code. Both codes have odd parity, with DQ7 as the parity bit.

## Read Mode

To obtain data at the device outputs, Chip Enable (CE\#/ PGM\#) and Output Enable (OE\#) must be driven low. CE\#/PGM\# controls the power to the device and is typically used to select the device. OE\# enables the device to output data, independent of device selection. Addresses must be stable for at least $\mathrm{t}_{\mathrm{ACC}}-\mathrm{t}_{\mathrm{OE}}$. Refer to the Switching Waveforms section for the timing diagram.

## Standby Mode

The device enters the CMOS standby mode when CE\#/PGM\# is at $\mathrm{V}_{\mathrm{CC}} \pm 0.3 \mathrm{~V}$. Maximum $\mathrm{V}_{\mathrm{CC}}$ current is reduced to $100 \mu \mathrm{~A}$. The device enters the TTL-standby mode when CE\#/PGM\# is at $\mathrm{V}_{\mathrm{IH}}$. Maximum $\mathrm{V}_{\mathrm{CC}}$ current is reduced to 1.0 mA . When in either standby mode, the device places its outputs in a high-impedance state, independent of the OE\# input.

## Output OR-Tieing

To accommodate multiple memory connections, a two-line control function is provided to allow for:

- Low memory power dissipation, and
- Assurance that output bus contention will not occur CE\#/PGM\# should be decoded and used as the primary device-selecting function, while OE\# be made a
common connection to all devices in the array and connected to the READ line from the system control bus. This assures that all deselected memory devices are in their low-power standby mode and that the output pins are only active when data is desired from a particular memory device.

## System Applications

During the switch between active and standby conditions, transient current peaks are produced on the rising and falling edges of Chip Enable. The magnitude of
these transient current peaks is dependent on the output capacitance loading of the device. At a minimum, a $0.1 \mu \mathrm{~F}$ ceramic capacitor (high frequency, low inherent inductance) should be used on each device between $V_{C C}$ and $V_{S S}$ to minimize transient effects. In addition, to overcome the voltage drop caused by the inductive effects of the printed circuit board traces on EPROM arrays, a $4.7 \mu \mathrm{~F}$ bulk electrolytic capacitor should be used between $\mathrm{V}_{\mathrm{CC}}$ and $\mathrm{V}_{\mathrm{SS}}$ for each eight devices. The location of the capacitor should be close to where the power supply is connected to the array.

## MODE SELECT TABLE

| Mode |  | CE\#/PGM\# | OE\# | AO | A9 | $V_{\text {PP }}$ | Outputs |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Read |  | $\mathrm{V}_{\text {IL }}$ | $\mathrm{V}_{\text {IL }}$ | X | X | X | D ${ }_{\text {OUT }}$ |
| Output Disable |  | $\mathrm{V}_{\text {IL }}$ | $\mathrm{V}_{\mathrm{IH}}$ | X | X | X | HIGH Z |
| Standby (TTL) |  | $\mathrm{V}_{\mathrm{IH}}$ | X | X | X | X | HIGH Z |
| Standby (CMOS) |  | $\mathrm{V}_{\mathrm{CC}}+0.3 \mathrm{~V}$ | X | X | X | X | HIGH Z |
| Program |  | $\mathrm{V}_{\text {IL }}$ | $\mathrm{V}_{\mathrm{IH}}$ | X | X | $V_{P P}$ | $\mathrm{D}_{\text {IN }}$ |
| Program Verify |  | $\mathrm{V}_{\text {IL }}$ | $\mathrm{V}_{\text {IL }}$ | X | X | $V_{P P}$ | Dout |
| Program Inhibit |  | $\mathrm{V}_{\mathrm{IH}}$ | X | X | X | $V_{P P}$ | HIGH Z |
| Auto Select (Note 3) | Manufacturer Code | $\mathrm{V}_{\text {IL }}$ | $\mathrm{V}_{\text {IL }}$ | $\mathrm{V}_{\text {IL }}$ | $\mathrm{V}_{\mathrm{H}}$ | X | 01h |
|  | Device Code | $\mathrm{V}_{\text {IL }}$ | $\mathrm{V}_{\text {IL }}$ | $\mathrm{V}_{\mathrm{IH}}$ | $\mathrm{V}_{\mathrm{H}}$ | X | 9Bh |

## Note:

1. $V_{\mathrm{H}}=12.0 \mathrm{~V} \pm 0.5 \mathrm{~V}$.
2. $X=$ Either $V_{I H}$ or $V_{I L}$
3. $A 1-A 8=A 10-A 18=V_{I L}$
4. See DC Programming Characteristics in the EPROM Products Data Book for $V_{P P}$ voltage during programming

## ABSOLUTE MAXIMUM RATINGS

Storage Temperature
OTP Products . . . . . . . . . . . . . . . . $-65^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$
All Other Products. . . . . . . . . . . . . . $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$
Ambient Temperature
with Power Applied. . . . . . . . . . . . . . $-55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$
Voltage with Respect to $\mathrm{V}_{\mathrm{SS}}$
All pins except A9, $V_{\text {PR }}$
$\mathrm{V}_{\mathrm{CC}}$ (Note 1) . . . . . . . . . . . . . . -0.6 V to $\mathrm{V}_{\mathrm{CC}}+0.5 \mathrm{~V}$
A9 and $\mathrm{V}_{\mathrm{PP}}$ (Note 2) . . . . . . . . . . . . -0.6 V to +13.5 V

1. During voltage transitions, inputs may overshoot $V_{S S}$ to 2.0 V for periods of up to 20 ns . Maximum DC voltage on input and I/O pins may overshoot to $V_{C C}+2.0 \mathrm{~V}$ for periods up to 20 ns .
2. During voltage transitions, $A 9$ and $V_{P P}$ may overshoot $V_{\text {Ss }}$ to -2.0 V for periods of up to 20 ns . A9 and $V_{\text {PP }}$ must not exceed +13.5 V at any time.
Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure of the device to absolute maximum rating conditions for extended periods may affect device reliability.

## OPERATING RANGES

## Commercial (C) Devices

Ambient Temperature ( $\mathrm{T}_{\mathrm{A}}$ ) $\ldots \ldots . . . .0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$
Industrial (I) Devices
Ambient Temperature ( $\mathrm{T}_{\mathrm{A}}$ ) . . . . . . . . $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$

## Extended (E) Devices

Ambient Temperature $\left(T_{A}\right) \ldots \ldots . .-55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$

## Supply Read Voltages

$V_{\text {CC }}$ for $\pm 5 \%$ devices . . . . . . . . . . +4.75 V to +5.25 V
$\mathrm{V}_{\mathrm{cc}}$ for $\pm 10 \%$ devices . . . . . . . . . +4.50 V to +5.50 V
Operating ranges define those limits between which the functionality of the device is guaranteed.

## DC CHARACTERISTICS over operating ranges unless otherwise specified

| Parameter Symbol | Parameter Description | Test Conditions |  | Min | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## REVISION SUMMARY FOR AM27C040

## Revision E/1

## Product Selector Guide:

Added -90 ( $90 \mathrm{~ns}, \pm 10 \% \mathrm{~V}_{\mathrm{CC}}$ ) and deleted -100 speed options.
Ordering Information, UV EPROM Products:
The -90 part number is now listed in the example.
Valid Combinations: Added -90 and deleted -100 speed options in valid combinations.
Ordering Information, OTP EPROM Products:
The -90 part number is now listed in the example.
Valid Combinations: Added -90 and deleted -100 speed options in valid combinations.

## Programming the Am27C040:

The fourth paragraph should read, "Please refer to Section 5 for programming...".

## Operating Ranges:

Changed Supply Read Voltages listings to match those in the Product Selector Guide.

## AC Characteristics:

Added -90 and deleted -100 speed options in table, rearranged notes, moved text from table title to Note 4, renamed table.

## Revision F

Deleted -255 speed option.
Changed all active low signal designations from overbars or trailing "\#"s.

## Revision G

## Global

Made formatting and layout consistent with other data sheets. Used updated common tables and diagrams.

## Distinctive Characteristics:

Low Power Consumption: Changed " $100 \mu \mathrm{~A}$ maximum" to "<10 $\mu$ A typical".

TSOP package deleted.

## General Description:

In the third paragraph, changed " $100 \mu \mathrm{~W}$ in standby mode" to $50 \mu \mathrm{~W}$ in standby mode".

## Connection Diagrams:

Deleted TSOP Pinout figure.

## Pin Designations:

Changed "Chip Enable Input" to "Chip Enable/Program Enable Input".

OTP EPROM Products: Changed -75 speed option to -90.
Temperature Range: Added " $\mathrm{E}=$ Extended $\left(-55^{\circ} \mathrm{C}\right.$ to $\left.125^{\circ} \mathrm{C}\right)^{\prime}$.
Package Type: Deleted "E = 32-pin Thin Small Outline Package (TSOP) Standard Pinout (TS 032)".
Valid Combinations: Deleted EC and EI options.

## Functional Description:

Replaced device specific text with generic text.

## Test Conditions:

New section with Test Setup Figure and Test Specifications Table.

## Switching Test Waveform:

Modified figure.

## Operating Ranges:

Supply Read Voltages: Replaced with generic data.
DC Characteristics:
Modified Figures 1 and 2.

## Switching Waveform:

Corrected "DF" to "t $t_{D F}$ " in Note 2.
Package Capacitance:
Deleted TSOP data.

## Physical Dimensions:

New section, added figures for the 32-Pin Ceramic DIP, 32-Pin Plastic DIP, and 32-Pin Plastic Leaded Chip Carrier.

## Ordering Information:

UV EPROM Products: Changed -75 speed option to -90.
