Safety

This transducer must be used in electric/electronic equipment with respect to applicable standards and safety requirements in accordance with the manufacturer's operating instructions.

Caution, risk of electrical shock

When operating the transducer, certain parts of the module can carry hazardous voltage (eg. primary busbar, power supply).

Ignoring this warning can lead to injury and/or cause serious damage.

This transducer is a build-in device, whose conducting parts must be inaccessible after installation.

A protective housing or additional shield could be used.

Main supply must be able to be disconnected.

Instructions for use of the voltage transducer model LV 25-P/SP5

Primary resistor R_1 : the transducer's optimum accuracy is obtained at the nominal primary current. As far as possible, R_1 should be calculated so that the nominal voltage to be measured corresponds to a primary current of 10 mA.

Example: Voltage to be measured $V_{PN} = 250$ V

a) $R_1 = 25$ k Ω / 2.5 W, $I_p = 10$ mA Accuracy = ± 0.8 % of V_{PN} (@ $T_A = +25^\circ\text{C}$)

b) $R_1 = 50$ k Ω / 1.25 W, $I_p = 5$ mA Accuracy = ± 1.6 % of V_{PN} (@ $T_A = +25^\circ\text{C}$)

Operating range (recommended): taking into account the resistance of the primary windings (which must remain low compared to R_1 , in order to keep thermal deviation as low as possible) and the isolation, this transducer is suitable for measuring nominal voltages from 10 to 1500 V.
