

PCA9512A; PCA9512B

Level shifting hot swappable I²C-bus and SMBus bus buffer

Rev. 5 — 5 January 2011

Product data sheet

1. General description

The PCA9512A/B is a hot swappable I²C-bus and SMBus buffer that allows I/O card insertion into a live backplane without corruption of the data and clock buses and includes two dedicated supply voltage pins to provide level shifting between 3.3 V and 5 V systems while maintaining the best noise margin for each voltage level. Either pin may be powered with supply voltages ranging from 2.7 V to 5.5 V with no constraints on which supply voltage is higher. Control circuitry prevents the backplane from being connected to the card until a stop bit or bus idle occurs on the backplane without bus contention on the card. When the connection is made, the PCA9512A/B provides bidirectional buffering, keeping the backplane and card capacitances isolated.

The PCA9512A or PCA9512B can be used if the rise of V_{CC} and V_{CC2} is simultaneous, but only the PCA9512B shall be used if the interval between rise of V_{CC} and V_{CC2} is not simultaneous.

The PCA9512A/B rise time accelerator circuitry allows the use of weaker DC pull-up currents while still meeting rise time requirements. The PCA9512A/B incorporates a digital input pin that enables and disables the rise time accelerators on all four SDA_n and SCL_n pins.

During insertion, the PCA9512A/B SDA_n and SCL_n pins are precharged to 1 V to minimize the current required to charge the parasitic capacitance of the chip.

The incremental offset design of the PCA9510A/11A/12A/12B/13A/14A I/O drivers allow them to be connected to another PCA9510A/11A/12A/12B/13A/14A device in series or in parallel and to the I²C compliant side of static offset bus buffers, but not to the static offset side of those bus buffers.

2. Features and benefits

- Bidirectional buffer for SDA and SCL lines increases fan-out and prevents SDA and SCL corruption during live board insertion and removal from multipoint backplane systems
- Compatible with I²C-bus Standard mode, I²C-bus Fast mode, and SMBus standards
- Built-in $\Delta V/\Delta t$ rise time accelerators on all SDA and SCL lines (0.6 V threshold) with ability to disable $\Delta V/\Delta t$ rise time accelerator through the ACC pin for lightly loaded systems, requires the bus pull-up voltage and respective supply voltage (V_{CC} or V_{CC2}) to be the same
- 5 V to 3.3 V level translation with optimum noise margin
- High-impedance SDA_n and SCL_n pins for V_{CC} or $V_{CC2} = 0$ V
- 1 V precharge on all SDA_n and SCL_n pins
- Supports clock stretching and multiple master arbitration and synchronization

- Operating power supply voltage range: 2.7 V to 5.5 V
- 0 Hz to 400 kHz clock frequency
- ESD protection exceeds 2000 V HBM per JESD22-A114, 200 V MM per JESD22-A115, and 1000 V CDM per JESD22-C101
- Latch-up testing is done to JEDEC Standard JESD78 which exceeds 100 mA
- Packages offered: SO8, TSSOP8 (MSOP8)

3. Applications

- cPCI, VME, AdvancedTCA cards and other multipoint backplane cards that are required to be inserted or removed from an operating system

4. Feature selection

Table 1. Feature selection chart

Feature	PCA9510A	PCA9511A	PCA9512A/B	PCA9513A	PCA9514A
Idle detect	yes	yes	yes	yes	yes
High-impedance SDAn, SCLn pins for V _{CC} = 0 V	yes	yes	yes	yes	yes
Rise time accelerator circuitry on SDAn and SCLn pins	-	yes	yes	yes	yes
Rise time accelerator circuitry hardware disable pin for lightly loaded systems	-	-	yes	-	-
Rise time accelerator threshold 0.8 V versus 0.6 V improves noise margin	-	-	-	yes	yes
Ready open-drain output	yes	yes	-	yes	yes
Two V _{CC} pins to support 5 V to 3.3 V level translation with improved noise margins	-	-	yes	-	-
1 V precharge on all SDAn and SCLn pins	in only	yes	yes	-	-
92 μA current source on SCLIN and SDAIN for PICMG applications	-	-	-	yes	-

5. Ordering information

7.2 Pin description

Table 3. Pin description

Symbol	Pin	Description
V _{CC2}	1	Supply voltage for devices on the card I ² C-bus. Connect pull-up resistors from SDAOUT and SCLOUT to this pin.
SCLOUT	2	serial clock output to and from the SCL bus on the card
SCLIN	3	serial clock input to and from the SCL bus on the backplane
GND	4	ground supply; connect this pin to a ground plane for best results.
ACC	5	CMOS threshold digital input pin that enables and disables the rise time accelerators on all four SDA _n and SCL _n pins. ACC enables all accelerators when set to V _{CC2} , and turns them off when set to GND.
SDAIN	6	serial data input to and from the SDA bus on the backplane
SDAOUT	7	serial data output to and from the SDA bus on the card
V _{CC}	8	supply voltage; from the backplane, connect pull-up resistors from SDAIN and SCLIN to this pin.

8. Functional description

Refer to [Figure 1 “Block diagram of PCA9512A/B”](#).

8.1 Start-up

When the PCA9512A/B is powered up, either V_{CC} or V_{CC2} may rise first, within a short time of each other and either may be more positive or they may be equal, however the PCA9512A/B will not leave the undervoltage lockout or initialization state until both V_{CC} and V_{CC2} have gone above 2.5 V. If either V_{CC} or V_{CC2} drops below 2.0 V it will return to the undervoltage lockout state. **Use of PCA9512B is required where the interval between rise of V_{CC} and V_{CC2} is not simultaneous.** In the undervoltage lockout state the connection circuitry is disabled, the rise time accelerators are disabled, and the precharge circuitry is also disabled. After both V_{CC} and V_{CC2} are valid, independent of which is higher, the PCA9512A/B enters the initialization state; during this state the 1 V precharge circuitry is activated and pulls up the SDA_n and SCL_n pins to 1 V through individual 100 kΩ nominal resistors. At the end of the initialization state the ‘Stop bit and

bus idle' detect circuit is enabled. When all the SDA_n and SCL_n pins have been HIGH for the bus idle time or when all pins are HIGH and a STOP condition is seen on the SDA_{IN} and SCL_{IN} pins, the connect circuitry is activated, connecting SDA_{IN} to SDA_{OUT} and SCL_{IN} to SCL_{OUT}. The 1 V precharge circuitry is disabled when the connection is made, unless the ACC pin is LOW; the rise time accelerators are enabled at this time also.

8.2 Connect circuitry

Once the connection circuitry is activated, the behavior of SDA_{IN} and SDA_{OUT} as well as SCL_{IN} and SCL_{OUT} become identical, with each acting as a bidirectional buffer that isolates the input bus capacitance from the output bus capacitance while communicating. If $V_{CC} \neq V_{CC2}$, then a level shifting function is performed between input and output. A LOW forced on either SDA_{IN} or SDA_{OUT} will cause the other pin to be driven to a LOW by the PCA9512A/B. The same is also true for the SCL_{IN} pins. Noise between $0.7V_{CC}$ and V_{CC} on the SDA_{IN} and SCL_{IN} pins, and $0.7V_{CC2}$ and V_{CC2} on the SDA_{OUT} and SCL_{OUT} pins is generally ignored because a falling edge is only recognized when it falls below $0.7V_{CC}$ for SDA_{IN} and SCL_{IN} (or $0.7V_{CC2}$ for SDA_{OUT} and SCL_{OUT} pins) with a slew rate of at least $1.25 \text{ V}/\mu\text{s}$. When a falling edge is seen on one pin, the other pin in the pair turns on a pull-down driver that is referenced to a small voltage above the falling pin. The driver will pull the pin down at a slew rate determined by the driver and the load. The first falling pin may have a fast or slow slew rate; if it is faster than the pull-down slew rate, then the initial pull-down rate will continue until it is LOW. If the first falling pin has a slow slew rate, then the second pin will be pulled down at its initial slew rate only until it is just above the first pin voltage then they will both continue down at the slew rate of the first.

Once both sides are LOW they will remain LOW until all the external drivers have stopped driving LOWs. If both sides are being driven LOW to the same (or nearly the same) value by external drivers, which is the case for clock stretching and is typically the case for acknowledge, and one side external driver stops driving, that pin will rise and rise above the nominal offset voltage until the internal driver catches up and pulls it back down to the offset voltage. This bounce is worst for low capacitances and low resistances, and may become excessive. When the last external driver stops driving a LOW, that pin will bounce up and settle out just above the other pin as both rise together with a slew rate determined by the internal slew rate control and the RC time constant. As long as the slew rate is at least $1.25 \text{ V}/\mu\text{s}$, when the pin voltage exceeds 0.6 V , the rise time accelerator circuits are turned on and the pull-down driver is turned off. If the ACC pin is LOW, the rise time accelerator circuits will be disabled, but the pull-down driver will still turn off.

8.3 Maximum number of devices in series

Each buffer adds about 0.1 V dynamic level offset at $25 \text{ }^\circ\text{C}$ with the offset larger at higher temperatures. Maximum offset (V_{offset}) is 0.150 V with a $10 \text{ k}\Omega$ pull-up resistor. The LOW level at the signal origination end (master) is dependent upon the load and the only specification point is the I²C-bus specification of 3 mA will produce $V_{\text{OL}} < 0.4 \text{ V}$, although if lightly loaded the V_{OL} may be $\sim 0.1 \text{ V}$. Assuming $V_{\text{OL}} = 0.1 \text{ V}$ and $V_{\text{offset}} = 0.1 \text{ V}$, the level after four buffers would be 0.5 V , which is only about 0.1 V below the threshold of the rising edge accelerator (about 0.6 V). With great care a system with four buffers may work, but as the V_{OL} moves up from 0.1 V , noise or bounces on the line will result in firing the rising edge accelerator thus introducing false clock edges. Generally it is recommended to limit the number of buffers in series to two, and to keep the load light to minimize the offset.

The PCA9510A (rise time accelerator is permanently disabled) and the PCA9512A/B (rise time accelerator can be turned off) are a little different with the rise time accelerator turned off because the rise time accelerator will not pull the node up, but the same logic that turns on the accelerator turns the pull-down off. If the V_{IL} is above ~ 0.6 V and a rising edge is detected, the pull-down will turn off and will not turn back on until a falling edge is detected.

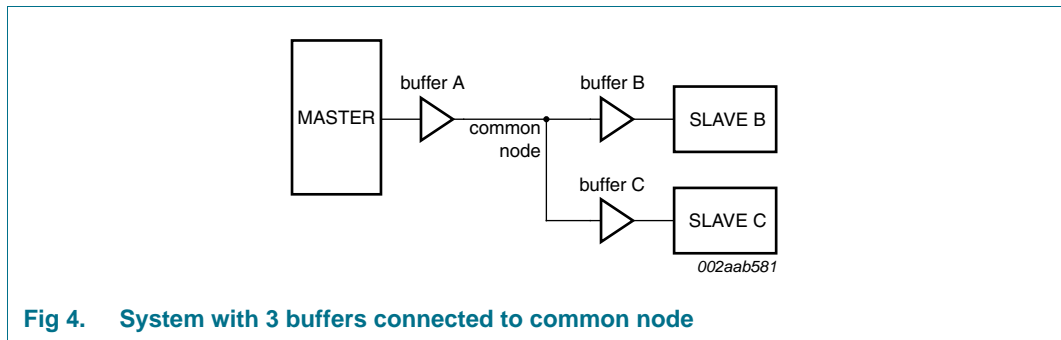

Fig 4. System with 3 buffers connected to common node

Consider a system with three buffers connected to a common node and communication between the Master and Slave B that are connected at either end of buffer A and buffer B in series as shown in Figure 4. Consider if the V_{OL} at the input of buffer A is 0.3 V and the V_{OL} of Slave B (when acknowledging) is 0.4 V with the direction changing from Master to Slave B and then from Slave B to Master. Before the direction change you would observe V_{IL} at the input of buffer A of 0.3 V and its output, the common node, is ~ 0.4 V. The output of buffer B and buffer C would be ~ 0.5 V, but Slave B is driving 0.4 V, so the voltage at Slave B is 0.4 V. The output of buffer C is ~ 0.5 V. When the Master pull-down turns off, the input of buffer A rises and so does its output, the common node, because it is the only part driving the node. The common node will rise to 0.5 V before buffer B's output turns on, if the pull-up is strong the node may bounce. If the bounce goes above the threshold for the rising edge accelerator ~ 0.6 V the accelerators on both buffer A and buffer C will fire contending with the output of buffer B. The node on the input of buffer A will go HIGH as will the input node of buffer C. After the common node voltage is stable for a while the rising edge accelerators will turn off and the common node will return to ~ 0.5 V because the buffer B is still on. The voltage at both the Master and Slave C nodes would then fall to ~ 0.6 V until Slave B turned off. This would not cause a failure on the data line as long as the return to 0.5 V on the common node (~ 0.6 V at the Master and Slave C) occurred before the data setup time. If this were the SCL line, the parts on buffer A and buffer C would see a false clock rather than a stretched clock, which would cause a system error.

8.4 Propagation delays

The delay for a rising edge is determined by the combined pull-up current from the bus resistors and the rise time accelerator current source and the effective capacitance on the lines. If the pull-up currents are the same, any difference in rise time is directly proportional to the difference in capacitance between the two sides. The t_{PLH} may be negative if the output capacitance is less than the input capacitance and would be positive if the output capacitance is larger than the input capacitance, when the currents are the same.

The t_{PHL} can never be negative because the output does not start to fall until the input is below $0.7V_{CC}$ (or $0.7V_{CC2}$ for SDAOUT and SCLOUT), and the output turn on has a non-zero delay, and the output has a limited maximum slew rate, and even if the input

slew rate is slow enough that the output catches up it will still lag the falling voltage of the input by the offset voltage. The maximum t_{PHL} occurs when the input is driven LOW with zero delay and the output is still limited by its turn-on delay and the falling edge slew rate. The output falling edge slew rate is a function of the internal maximum slew rate which is a function of temperature, V_{CC} or V_{CC2} and process, as well as the load current and the load capacitance.

8.5 Rise time accelerators

During positive bus transactions, a 2 mA current source is switched on to quickly slew the SDA and SCL lines HIGH once the input level of 0.6 V for the PCA9512A/B is exceeded. The rising edge rate should be at least 1.25 V/ μ s to guarantee turn on of the accelerators. The built-in $\Delta V/\Delta t$ rise time accelerators on all SDA and SCL lines requires the bus pull-up voltage and respective supply voltage (V_{CC} or V_{CC2}) to be the same. The built-in $\Delta V/\Delta t$ rise time accelerators can be disabled through the ACC pin for lightly loaded systems.

8.6 ACC boost current enable

Users having lightly loaded systems may wish to disable the rise time accelerators. Driving this pin to ground turns off the rise time accelerators on all four SDA_n and SCL_n pins. Driving this pin to the V_{CC2} voltage enables normal operation of the rise time accelerators.

8.7 Resistor pull-up value selection

The system pull-up resistors must be strong enough to provide a positive slew rate of 1.25 V/ μ s on the SDA_n and SCL_n pins, in order to activate the boost pull-up currents during rising edges. Choose maximum resistor value using the formula given in [Equation 1](#):

$$R_{PU} \leq 800 \times 10^3 \left(\frac{V_{CC(min)} - 0.6}{C} \right) \tag{1}$$

where R_{PU} is the pull-up resistor value in Ω , $V_{CC(min)}$ is the minimum V_{CC} voltage in volts, and C is the equivalent bus capacitance in picofarads.

In addition, regardless of the bus capacitance, always choose $R_{PU} \leq 65.7 \text{ k}\Omega$ for $V_{CC} = 5.5 \text{ V}$ maximum, $R_{PU} \leq 45 \text{ k}\Omega$ for $V_{CC} = 3.6 \text{ V}$ maximum. The start-up circuitry requires logic HIGH voltages on SDAOUT and SCLOUT to connect the backplane to the card, and these pull-up values are needed to overcome the precharge voltage. See the curves in [Figure 5](#) and [Figure 6](#) for guidance in resistor pull-up selection.

8.8 Hot swapping and capacitance buffering application

Figure 7 through Figure 9 illustrate the usage of the PCA9512A in applications that take advantage of both its hot swapping and capacitance buffering features. In all of these applications, note that if the I/O cards were plugged directly into the backplane, all of the backplane and card capacitances would add directly together, making rise time and fall time requirements difficult to meet. Placing a bus buffer on the edge of each card, however, isolates the card capacitance from the backplane. For a given I/O card, the PCA9512A drives the capacitance of everything on the card and the backplane must drive only the capacitance of the bus buffer, which is less than 10 pF, the connector, trace, and all additional cards on the backplane.

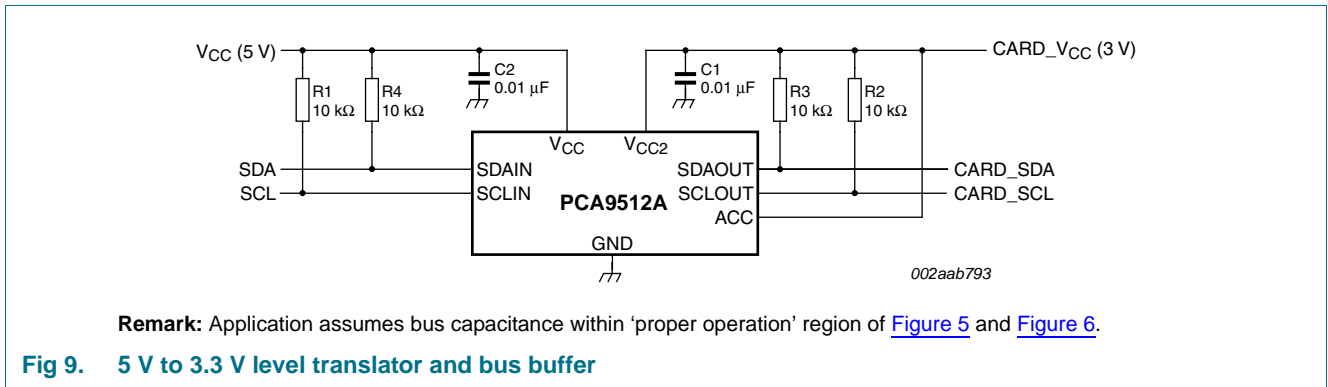

See Application Note AN10160, 'Hot Swap Bus Buffer' for more information on applications and technical assistance.

14. Soldering of SMD packages

This text provides a very brief insight into a complex technology. A more in-depth account of soldering ICs can be found in Application Note *AN10365 "Surface mount reflow soldering description"*.

14.1 Introduction to soldering

Soldering is one of the most common methods through which packages are attached to Printed Circuit Boards (PCBs), to form electrical circuits. The soldered joint provides both the mechanical and the electrical connection. There is no single soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and Surface Mount Devices (SMDs) are mixed on one printed wiring board; however, it is not suitable for fine pitch SMDs. Reflow soldering is ideal for the small pitches and high densities that come with increased miniaturization.

14.2 Wave and reflow soldering

Wave soldering is a joining technology in which the joints are made by solder coming from a standing wave of liquid solder. The wave soldering process is suitable for the following:

- Through-hole components
- Leaded or leadless SMDs, which are glued to the surface of the printed circuit board

Not all SMDs can be wave soldered. Packages with solder balls, and some leadless packages which have solder lands underneath the body, cannot be wave soldered. Also, leaded SMDs with leads having a pitch smaller than ~0.6 mm cannot be wave soldered, due to an increased probability of bridging.

The reflow soldering process involves applying solder paste to a board, followed by component placement and exposure to a temperature profile. Leaded packages, packages with solder balls, and leadless packages are all reflow solderable.

Key characteristics in both wave and reflow soldering are:

- Board specifications, including the board finish, solder masks and vias
- Package footprints, including solder thieves and orientation
- The moisture sensitivity level of the packages
- Package placement
- Inspection and repair
- Lead-free soldering versus SnPb soldering

14.3 Wave soldering

Key characteristics in wave soldering are:

- Process issues, such as application of adhesive and flux, clinching of leads, board transport, the solder wave parameters, and the time during which components are exposed to the wave
- Solder bath specifications, including temperature and impurities

14.4 Reflow soldering

Key characteristics in reflow soldering are:

- Lead-free versus SnPb soldering; note that a lead-free reflow process usually leads to higher minimum peak temperatures (see [Figure 18](#)) than a SnPb process, thus reducing the process window
- Solder paste printing issues including smearing, release, and adjusting the process window for a mix of large and small components on one board
- Reflow temperature profile; this profile includes preheat, reflow (in which the board is heated to the peak temperature) and cooling down. It is imperative that the peak temperature is high enough for the solder to make reliable solder joints (a solder paste characteristic). In addition, the peak temperature must be low enough that the packages and/or boards are not damaged. The peak temperature of the package depends on package thickness and volume and is classified in accordance with [Table 6](#) and [7](#)

Table 6. SnPb eutectic process (from J-STD-020C)

Package thickness (mm)	Package reflow temperature (°C)	
	Volume (mm ³)	
	< 350	≥ 350
< 2.5	235	220
≥ 2.5	220	220

Table 7. Lead-free process (from J-STD-020C)

Package thickness (mm)	Package reflow temperature (°C)		
	Volume (mm ³)		
	< 350	350 to 2000	> 2000
< 1.6	260	260	260
1.6 to 2.5	260	250	245
> 2.5	250	245	245

Moisture sensitivity precautions, as indicated on the packing, must be respected at all times.

Studies have shown that small packages reach higher temperatures during reflow soldering, see [Figure 18](#).

For further information on temperature profiles, refer to Application Note AN10365 “Surface mount reflow soldering description”.

15. Abbreviations

Table 8. Abbreviations

Acronym	Description
AdvancedTCA	Advanced Telecommunications Computing Architecture
CDM	Charged-Device Model
cPCI	compact Peripheral Component Interface
ESD	Electrostatic Discharge
HBM	Human Body Model
I ² C-bus	Inter-Integrated Circuit bus
MM	Machine Model
PCI	Peripheral Component Interface
PICMG	PCI Industrial Computer Manufacturers Group
SMBus	System Management Bus
VME	VERSAModule Eurocard

16. Revision history

Table 9. Revision history

Document ID	Release date	Data sheet status	Change notice	Supersedes
PCA9512A_PCA9512B v.5	20110105	Product data sheet	-	PCA9512A v.4
Modifications:		<ul style="list-style-type: none"> • Added basic type number PCA9512B • Section 1 “General description”: <ul style="list-style-type: none"> – added (new) second paragraph – fifth paragraph re-written • Section 8.1 “Start-up” modified: <ul style="list-style-type: none"> – first sentence: inserted phrase “within a short time of each other” – added (new) third sentence 		
PCA9512A v.4	20090819	Product data sheet	-	PCA9512A v.3
PCA9512A v.3	20090720	Product data sheet	-	PCA9512A v.2

PCA9512A v.1	20051007	Product data sheet	-	-

17. Legal information

17.1 Data sheet status

Document status ^{[1][2]}	Product status ^[3]	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <http://www.nxp.com>.

17.2 Definitions

Draft — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

Product specification — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

17.3 Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the *Terms and conditions of commercial sale* of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or

malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors accepts no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <http://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from national authorities.

Non-automotive qualified products — Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond NXP Semiconductors' specifications such use shall be solely at customer's

own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.
